Chatroom App

Group Members:
Alex, Andrew, Anthony, Juhee

## Project 2, UCLA Extension Full Stack Bootcamp

User Story:

When a user visits our website they will be able to enter thematized chat-rooms based on their interests. Our application will allows users to communicate, share content, form chat groups based around common interests. Users can search for one another, while also customizing their personal settings to share their phone-number, email, and other contact information if they'd like to.

Task Breakdown:

Initially, we are all working together to discuss the UI/UX of the application. Once we've laid out our basic HTML, and organized all of our libraries and packages, we'll be breaking up into two teams. Andrew & Anthony will work collaboratively on the HTML/CSS while Juhee & Alex will sort out all of the Requests & Routes. We'll finish up by connecting all of the functionality using Javascript.
